

The Secure Boot Certificates are coming... The Secure Boot Certificates are coming...

Heads Up !!!

Secure Boot Certificates 2011 are EXPIRING Late June 2026 – Windows 8 era

Secure Boot Certificates 2023 are available from Windows Updates April 2026

Secure Boot certificates are crucial because they help ensure that only trusted, digitally signed software can run during the startup process of a device, preventing malware from loading.

This security feature protects the system from sophisticated threats right from the moment it powers on.

Checking Secure Boot Certificate Status

To determine if your Secure Boot certificates are up to date, you can use PowerShell commands and the Windows Security app.

Using PowerShell

1. Open PowerShell as Administrator.
2. Run the following commands:

Command	Purpose
---------	---------

<code>Confirm-SecureBootUEFI</code>	Checks if Secure Boot is enabled and functioning properly. It should return True.
-------------------------------------	---

Command

Purpose

Get-SecureBootPolicy Displays the current Secure Boot policy. Ensure there are no expired or invalid entries.

`[System.Text.Encoding]::ASCII.GetString((Get-SecureBootUEFI db).bytes) - match 'Windows UEFI CA 2023'`

Verifies if the 2023 Secure Boot certificate is present in the Active Database.

Using Windows Security App

1. Open the **Windows Security app**.
2. Navigate to **Device security**.
3. Look for the **Secure Boot** section, which will indicate if Secure Boot is enabled and if the certificates are up to date.

Windows Security App

The screenshot shows the Windows Security application interface. On the left is a navigation pane with the following items: Windows Security (highlighted in red), Home, Virus & threat protection, Account protection, Firewall & network protection, App & browser control, Device security (highlighted in red), Device performance & health, Family options, and Protection history. The main content area displays the 'Device security' page. It includes a title 'Device security' with a shield icon, a subtitle 'Security that comes built into your device.', and several security features: 'Core isolation' (with a shield icon), 'Security processor' (with a gear icon), 'Secure boot' (with a shield icon and highlighted in red), and 'Data encryption' (with a shield icon). Each feature has a brief description and a 'Learn more' link. The 'Secure boot' section also includes a 'Dismiss' link.

How to Obtain Secure Boot Certificates via Windows Update

To obtain the latest Secure Boot certificates, ensure that Windows Update is enabled and install all available cumulative updates for Windows 11. This will automatically download and apply the new certificates to your device.

Windows Update

Restart required (estimate: 3 min)

Your device will restart outside of active hours.

Restart now

Microsoft Corporation AudioProcessingObject Driver Update (10.0.26100.6710)	Pending install
HP Inc. Extension Driver Update (2602.0.1.0)	Pending install
Windows Malicious Software Removal Tool x64 - v5.140 (KB890830)	Completed
2026-04 .NET Framework Security Update (KB5082417)	Installing - 0%
2026-04 Security Update (KB5083769) (26200.8246)	Downloading - 5%
Secure Boot Allowed Key Exchange Key (KEK) Update	Pending restart

Most Windows computers will automatically receive Secure Boot certificate updates through Windows Update

The following conditions must be met for automatic updates to occur:

Secure Boot Enabled: The Secure Boot feature must be activated in the system's firmware settings.

Supported Windows Versions: The device must be running a supported version of Windows, such as Windows 11.

Windows 10 with Extended Security Updates (ESU) probably will

However, some older devices may not receive these updates if their firmware does not support them.

Using PowerShell to Retrieve Secure Boot Certificates

Expected Output will display details about the certificates, including their names and attributes. This information helps verify that the correct Secure Boot certificates are installed on your system.

1. Open PowerShell as Administrator:
 - Search for PowerShell in the Start menu.
 - Right-click on Windows PowerShell and select "Run as administrator."

2. Run the Commands in Powershell:

- Type the following command to check the Secure Boot database:

```
Get-SecureBootUEFI -Name db
```

- Then, check the Key Exchange Key with:

```
Get-SecureBootUEFI -Name KEK
```

Obtain and Save the BitLocker Key

If there is a problem with the Secure Boot Certificates and BitLocker is active on Windows Pro, Enterprise or Education editions there could be a problem even accessing an encrypted drive without the BitLocker Key.

BitLocker Keys can generally be seen in your Microsoft Account associated with the computer.

Also in Windows Security

Data Encryption

Print or Save a Snip

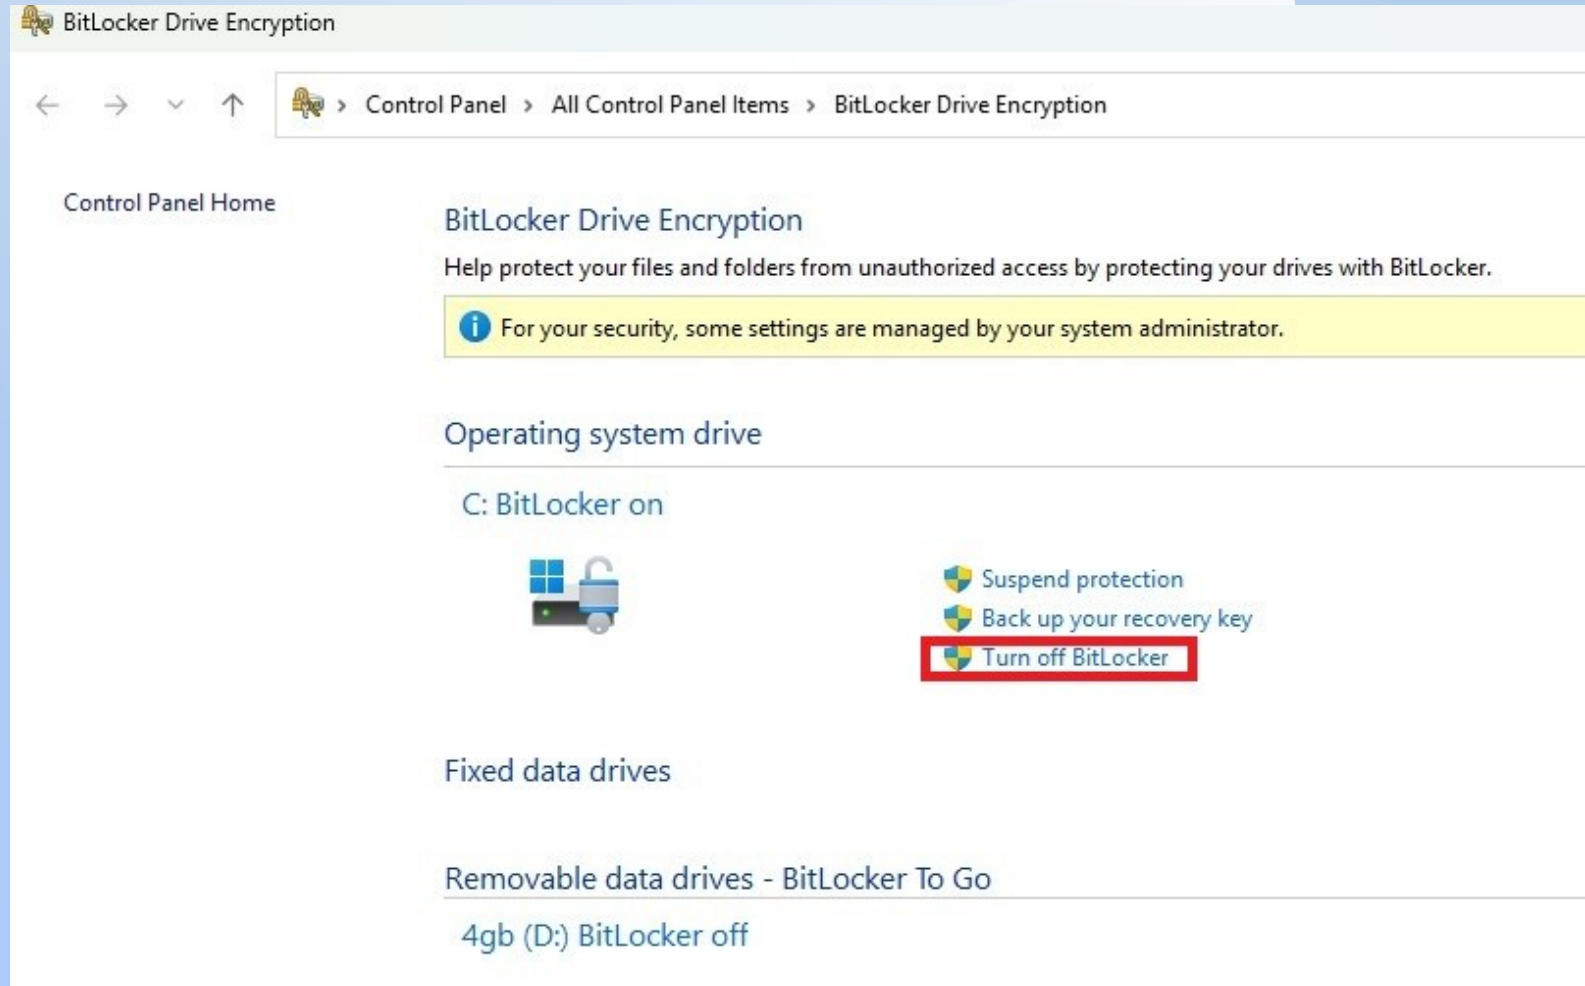

BitLocker recovery keys

Device Name	Key ID	Recovery Key	Drive	Key upload date
DELL1	65D4E4	204204-477499-059048-444411-441991-490908-398772-0843C	OSV	2/11/2026 7:59:39 PM +00:00

Obtain and Save the BitLocker Key

BitLocker can be Suspended or even Turned Off in Control Panel

Back Up Key option

To force the installation of the Windows UEFI CA 2023 Secure Boot certificates via PowerShell

1. Suspend BitLocker (if enabled) If your drive is encrypted, suspend protection for the required reboot cycles:

```
manage-bde -Protectors -Disable C: -RebootCount 1
```

Note: Some scripts recommend -RebootCount 2 to ensure the update completes fully.

Note: Windows Home does not have BitLocker but it can have Device Encryption found in Windows Security App

2. Set the Registry Key Open PowerShell as Administrator and run the following command to trigger the deployment of all necessary certificates (including the new CA 2023 and boot manager):

```
reg add HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Secureboot /v AvailableUpdates /t REG_DWORD /d 0x5944 /f
```

0x5944: Deploys all certificates and updates the boot manager.

0x5be6: Deploys certificates and revokes the old PCA 2011 cert (use with caution).

0x40: Deploys only the Windows UEFI CA 2023 to the DB.

3. Trigger the Update Task Start the secure boot update scheduled task:

```
Start-ScheduledTask -TaskName "\Microsoft\Windows\PI\Secure-Boot-Update"
```

4. Reboot and Verify Restart your computer. The process may require two reboots to fully write the firmware changes. Afterward, verify the installation with:

```
[System.Text.Encoding]::ASCII.GetString((Get-SecureBootUEFI db).bytes) -match 'Windows UEFI CA 2023'
```

If the output is True, the new certificate is installed.

If you suspended BitLocker, resume it with `Resume-BitLocker -MountPoint "C:"`.

Administrator: Windows PowerShell

Windows PowerShell

Install the latest PowerShell for new features and improvements! <https://aka.ms/PSWindows>

```
PS C:\WINDOWS\system32> [System.Text.Encoding]::ASCII.GetString((Get-SecureBootUEFI db).bytes) -match 'Windows UEFI CA 2023'  
False
```

```
PS C:\WINDOWS\system32> reg add HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Secureboot /v AvailableUpdates /t REG_DWORD /d 0x5944 /f  
The operation completed successfully.
```

```
PS C:\WINDOWS\system32> Start-ScheduledTask -TaskName "\Microsoft\Windows\PI\Secure-Boot-Update"
```

```
PS C:\WINDOWS\system32> [System.Text.Encoding]::ASCII.GetString((Get-SecureBootUEFI db).bytes) -match 'Windows UEFI CA 2023'  
True
```

```
PS C:\WINDOWS\system32>
```

For enterprise environments, you can also deploy this via Group Policy by enabling Computer Configuration > Administrative Templates > Windows Components > Secure Boot > Enable Secure Boot certificate deployment policy.

To install Secure Boot certificates via an OEM BIOS update, ensure your device's BIOS is updated to a version that includes the new Secure Boot certificates.

This typically involves downloading the appropriate BIOS update from the OEM's website and following their specific installation instructions.

Important Note : Most devices manufactured since 2024 should already have the updated Secure Boot certificates.

To obtain motherboard information using System Information, press Windows + R, type msinfo32, and hit Enter.

In the System Summary, look for BaseBoard Manufacturer, BaseBoard Product, and BaseBoard Version to find your motherboard details.

- BaseBoard Manufacturer: This shows the manufacturer of your motherboard.
- BaseBoard Product: This indicates the model of your motherboard.
- BaseBoard Version: This provides the version number of your motherboard.

Note: This is a good article on Secure Boot 2023 Certificate Updates

Written by Ed Bott, Senior Contributing Editor March 12, 2026 at 5:53 a.m. PT

<https://www.zdnet.com/article/secure-boot-certificate-updates-2026/>

“How to check your Windows PC for expiring security certificates - a big one is ending soon”

To see whether your PC has the updated certificates, open a PowerShell window using administrator credentials and then copy the following command and paste it at the PowerShell command line:

```
([System.Text.Encoding]::ASCII.GetString((Get-SecureBootUEFI db).bytes) -match 'Windows UEFI CA 2023')
```
